

# Graphing Sine and Cosine

<p><b>KNOW</b> How to identify the amplitude and period of a trig function. What a sinusoidal function looks like.</p>	<p><b>DO</b> Can graph a trig function from the equation or characteristics accurately. Can build the equation of a trig function from the graph or characteristics accurately.</p>	<p><b>UNDERSTAND</b> <i>Transformation:</i> Can explain how certain characteristics are or are not affected by a transformation. <i>Function Characteristics:</i> How the amplitude relates to the max/min values, midline as the average, period as the frequency, and shift as the start.</p>
<p><b>Vocab &amp; Notation</b></p> <ul style="list-style-type: none"> <li>• Amplitude</li> <li>• Period</li> <li>• Midline</li> <li>• Phase Shift</li> <li>• Sinusoidal function</li> </ul>		

Using a unit circle, graph the angle  $\theta$  and the values of  $\sin \theta$  and  $\cos \theta$ .

**Definition:** Functions that repeat after a certain amount of time are called **periodic functions** (periodic meaning occurring at regular intervals). Periodic functions that have this regular “wave” shape are called **sinusoidal functions**.

We want to analyze this curve so that we can graph functions of the form:

$$a \cdot \sin(b(x - c)) + d$$

**Definition:** The **midline** is the average value of the function.

**Definition:** The **amplitude** is the distance from the midline to the maximum or minimum, or equivalently, half the distance between the max and min.

**Definition:** The **period** is the length of one complete cycle of a periodic function. Not necessarily how long it takes to repeat itself, but how long it takes to repeat the pattern.

**Definition:** The **phase shift** is where the starting point of  $\theta = 0$  got moved to.

When transforming a new function, we need to understand the basic function well to start.

**Example:** Graph  $f(\theta) = 3 \sin\left(\frac{1}{2}\left(\theta - \frac{\pi}{4}\right)\right) + 1$

- Identify the midline from the vertical displacement
- Use the amplitude to find the max and min lines
- Use the phase shift to identify the starting point
- Split the period into quarters.

**Example:** Determine 3 different equations that could describe the following function.

**Example:** Determine two equations (one sine, one cosine) that could describe a sinusoidal function that has two minimums at  $(-1, -3)$  and  $(3, -3)$  and has an amplitude of 0.5.
