

Area Under a Curve Part 1

Goal:

- Can define the area under any curve using a Riemann Sum and limit.

Terminology:

- Riemann Sum

Discussion question: Why is the area of a circle πr^2

Let's use this idea with an arbitrary shape.

I have built a calculator for you to partition a region into n subintervals

<https://www.desmos.com/calculator/t17czhwjyl>

Example: Approximate the area under the parabola $f(x) = 4 - x^2$ on the interval $[-2, 2]$ using 4 subintervals ($n = 4$).

Practice: Determine the area under the curve $f(x) = -x^3 + 2x^2$ on the interval $[-1, 2]$ using 6 subintervals

Practice Problems: 10.4 # 1, 3&4 (write the area as a limit $n \rightarrow \infty$ and approximate using $n = 4$, use the calculator to determine the area to 1 or 2 decimals of accuracy)
